Mexican Spotted Owl Habitat Environmental Analysis Project Checklist June 7, 2021

The purpose of this document is to assist and guide Interdisciplinary Teams (IDT) on how to conduct environmental analysis for vegetation management projects that would implement mechanical and prescribed fire treatments within Mexican spotted owl habitat.

All vegetation management project documentation/analysis are required to address the following list of items to assure consistency with forest plans and the Recovery Plan (RP) for the Mexican spotted owl (MSO), First Revision (USFWS 2012).

*As the IDT conducts the analysis it should consider the caution on pages 74-75 in the 2012 Recovery Plan that much of the work needed to reduce the fire risk to Mexican spotted owl habitat can be achieved by treating areas outside of PACs and Recovery nest/roost habitat to develop forest structure and density conditions that facilitate low severity surface fires in the surrounding project landscape. Often, these forest restoration treatments outside the PACs can be combined with minimal treatments inside the PACs such as low thinning, selection cutting, and prescribed burning to also facilitate lower severity fire behavior potential within the PACs. Management approaches to protecting and enhancing PAC habitats should be based on local existing and projected vegetation conditions, and management alternatives focused on the minimal treatments necessary to protect or enhance PAC habitats.

Project: Rock Creek TS

District, Forest: Cuba RD, Santa Fe NF

Date: 07/15/2021 (Prepared by Ramon Borrego. Reviewed and approved by Andre M. Silva on 08132021)

| 1. If treatments are proposed in recovery nest, specific information for why treatments are option or if conditions are not suitable as rec will directly improve owl habitat., Provide p related to Table C.3 in the Recovery Plan, Fir in the original MSO Recovery Plan (USFWS 1 amendment to your forest plan. Describe ho not treat the minimums in Table C.3 as targe needed. | necessary and why deferment isn't an overy habitat and how the treatment ost-treatment condition information as st Revision (USFWS 2012), or Table III.B.1 (1995) if working under the 1996 w it meets Forest Plan requirements. Do | | As stated above, there is a need to move the current condition of mixed conifer forests within the project area closer to the desired conditions of Table C.3. In general, Recovery Nest Roost habitat is lacking within the project area (i.e., large tree component in mixed conifer stands). Treatments within mixed conifer will facilitate moving stand trajectories closer to recovery nest roost by thinning small diameter trees. However, it is unlikely that any of the stands within the project area would meet Table C.3 within the 'reasonably foreseeable future' (20-30yr) timeframe described by the 2012 Recovery Plan. This is because of the close proximity of the stands to high use recreation areas, the stands being interspersed with pure ponderosa pine stands and – the topographic positioning of the stands does not lend its self to development of nest roost habitat. They do not have high topographic relief, are drier sites and would not make suitable nesting areas in the near future. |
| 2. Replacement nest/roost habitat post-treatm | ent variables: | | |

| IV. Description of pre and post treatment conditions in <u>Critical Habitat</u> – Critical habitat is specific geographic areas that are essential for the conservation of a | | |
| threatened or endangered species and that may require special management considerations. Primary constituent elements (PCE's) are found within these specific geographic areas. PCE's are essential to the conservation of the owl and include those | | |
| physical and biological features that support nesting, roosting, and foraging. Designated | | |
| critical habitat only exists in areas defined as MSO habitat in the 1995 Recovery plan and its 2012 revision see https://ecos.fws.gov/ecp/report/criticalHabitat . | | |
| A. Primary constituent elements related to forest structure : | ✓ | |
| | | Of the 176 acres of critical habitat, 20 acres meet forest structure (A) and high volumes of fallen trees and other woody debris (B1). |
| 1. a range of tree species, including mixed conifer, pine-oak, and riparian forest types, | | |
| composed of different tree sizes reflecting different ages of trees, 30 percent to 45 percent of which are large trees with a trunk diameter of 12 inches (0.3 meters) or more when measured at 4.5 feet (1.4 meters) from the ground; | | |
| a shade canopy created by the tree branches covering 40 percent or more of the ground; and | | |
| 3. large dead trees (snags) with a trunk diameter of at least 12 inches (0.3 meters) when measured at 4.5 feet (1.4 meters) from the ground. | | |
| B. Primary constituent elements related to maintenance of adequate prey: | ✓ | |
| | | Of the 176 acres of critical habitat, 20 acres meet forest structure (A) and high volumes of fallen trees and other woody debris (B1). |
| High volumes of fallen trees and other woody debris; | | |
| 2. A wide range of tree and plant species, including hardwoods; and | | |
| Adequate levels of residual plant cover to maintain fruits, seeds, and allow plant regeneration. | | |
| C. <u>Primary constituent elements related to canyon habitat</u> include one or more of the following: | ✓ | Although Canyon Habitat does not occur within the project area, it may be present within the action area and the larger landscape of the Jemez Mountains on the Santa Fe National Forest. |
| presence of water (often providing cooler and often higher humidity than the surrounding areas); | | |
| clumps or stringers of mixed conifer, pine-oak, pinyon-juniper, and/or riparian vegetation. | | |
| canyon wall containing crevices, ledges, or caves; and | | |
| 4. high percent of ground litter and woody debris. | | |
| Develop monitoring plan with the FWS, may include one or both of the following: | | No PACs present. No additional MSO monitoring required. Additional timber and fuels data collection will occur. |
| | | No post treatment MSO monitoring required. Post treatment common stand exam and fuels treatment monitoring will occur to verify treatments. |
| Monitor occupancy and reproduction in treated Mexican spotted owl PACs Management Experiments for treatments in PACs (Box C.5, pp. 281-283, 2012 MSO RP) | | |
| 3. Monitor pre- and post-treatment | | |
| Report implementation of the action and compliance with the terms and conditions as | | |
| required by the reasonable and prudent measures in the incidental take statement of the biological opinion, or other consultation document (e.g., measures included in concurrence | | |
| letter for NLAA determinations), and associated NEPA documentation and analysis and make | <u> </u> | <u> </u> |

| available to the Public This will be done by utilizing the guidance provided in the Regional | |
|--|--|
| MSO Habitat Vegetation Management Implementation Guidance. | |

- *if stand exam data exists for delineated nest/roost recovery habitat at the time of the analysis, then follow MSO habitat treatment implementation guidance to conduct the analysis and develop the proposed action.
- ¹% of area pertains to the percent of the planning area, subregion, and/or region in the specified forest type that should be managed for threshold conditions.
- ²BAs in m₂/ha (ft₂/acre) and include all trees >1inch dbh (i.e., any species). We emphasize that values shown are **minimums**, not targets.
- ³Trees > 46 cm (18 inches) dbh. Density is tree/ha (trees/acre). Again, values shown are minimums rather than targets. We encourage retention of large trees.
- ⁴Pine-oak forest type: $\ge 10\%$ of the stand BA or 4.6 m₂/ha (20 ft₂/ac) of BA consist of Gambel oak ≥ 13 cm (5 in) diameter a root collar.
 - ⁵Pine-oak recommendations apply only to the Mount Taylor and/or Zuni Mountains regions within the CP EMU.

Please also refer to Appendix C in the 2012 Mexican Spotted Owl Recovery Plan, First Revision, for recommended management actions, monitoring treatment effects, and information on desired conditions for nest/roost core areas, PACs, and recovery habitat.

Table C.2 and C.3 in Appendix C of the Mexican Spotted Owl Recovery Plan, First Revision (USFWS 2012) referenced above in the checklist.

Table C.2. (Below) Generalized description of key habitat variables comprising Desired Conditions in forest, riparian, canyon, and woodland cover types typically used by Mexican spotted owls for nesting and roosting. **Desired conditions should guide management within PACs and recovery nest/roost habitats.** The ecological relevance of each desired condition to this owl subspecies and examples of variables that may be useful to quantify desired conditions are also shown. Where possible numbers are derived from past research, where information was unavailable, we used the collective best professional knowledge of the Recovery Team.

| 276 Desired Condition | Relevance to Owl | Potential Variables |
|---|---|--|
| | | (Examples) |
| Strive for a diversity of patch sizes with minimum contiguous patch size of 1 ha (2.5 ac) with larger patches near activity center; mix of sizes towards periphery (Peery et al 1999; Grubb et al 1997; May and Gutiérrez 2002). Forest type may dictate patch size (i.e., mixed conifer forests have larger and fewer patches than pine-oak forest). Strive for between patch heterogeneity. | Nest/roost habitat patches are the most limiting habitat for the owl. Patches should enhance spatial heterogeneity, provide nest/roost options, provide varied microclimates (thermoregulation) options, and create edges for prey species (e.g., <i>Neotoma</i>). | Size, cumulative acreage, density of patches, % of landscape, amount of edge habitat, average patch canopy cover, average age of dominant overstory component of patch. Frequency distribution of patches by size class, total edge, core to edge distance, fractal index of patch (area to edge ratios). |
| Horizontal and vertical habitat heterogeneity within patches, including tree species composition.* Patches are contiguous and consist of trees of all sizes, unevenly spaced, with interlocking crowns and high canopy cover (Ganey et al. 2003).* | Provides roosting options, thermal and hiding cover for the owl, and habitat for a variety of prey species. | Patch size and configuration (shape), juxtaposition (topology of patches), interspersion, edge length; canopy cover by height strata; number of vegetation strata present (herbaceous, shrub, sapling, pole, mature trees); uneven tree spacing. |
| Tree species diversity, especially with a mixture of hardwoods and shade-tolerant species (Willey 1998).* For example, Gambel oak provides important habitat for woodrats and brush mice (Block et al. 2005, Ward 2001) | Provides habitat and food sources for a diversity of prey, roosting options, and perches and hiding cover for young owls during early flight development. Large tree-form Gambel oaks are an important nesting substrate for owls (Ganey et al 1992; SWCA 1992; May and Gutiérrez 2002). Diversity increases probability of some tree species setting seed in a given year. Owls use hardwoods (e.g., bigtoothed maple, western hop hornbeam and chinkapin oak) for roosting (Mullet and Ward 2010) | Species occurrence (presence), diversity indices (including richness and equitability), BA by species, density/species. |
| Diverse composition of vigorous native herbaceous and shrub species (Ward 2001).* | Provides sustainable habitat for a variety of prey; fine fuels to carry surface fire. | Cover/plant group; plant height; vertical density profile; diversity measure (e.g., richness and equitability); vertical distribution; maximum height. |
| Opening sizes between 0.04 - 1 ha (0.1 - 2.5 ac).* Openings within a forest are different than natural meadows. Small canopy gaps within forested patches provide for prey habitat diversity. Openings should be small in nest/roost patches, may be larger in rest of PAC. | Openings provide habitat for a variety of prey and can slow or reduce fire severity by breaking the continuity of dense tree canopies and ladder fuels. | Frequency distribution of openings by size class, % of landscape in openings. Grass and herbaceous cover in openings (Daubenmire plots for coverage percent). |
| Minimum canopy cover of 40% in pine-oak and 60% in mixed conifer (Ganey et al. 2003).* Measure canopy cover within stands. | Provides thermal environment needed for nesting/roosting and prey habitat. | Canopy cover line or point intercept method). |

Table C.3. Minimum desired conditions for mixed-conifer and pine-oak forest areas managed for Recovery nesting/roosting habitat. Forest types are defined in Appendix C, above. Parameter values are based on averages among plots sampled within forest stands. Numbers of stands included in analysis: 74 for Basin and Range-East (BRE), 27 for mixed-conifer forest in other EMUs, and 47 for pine-oak forest.

| EMU(s) | % of Area ¹ | | BA ze class | Minimum | Minimum |
|---|------------------------|-------------------------------|-------------------------|----------------------|---|
| Forest Type | | 30-46 cm dbh (12-18 in) | >46 cm dbh (>18") | tree BA ² | density of large trees ³ |
| BRE Mixed-conifer | 20 | >30 | >30 | 33.3 (145) | 37 (15) |
| CP, UGM, SRM, BRW Mixed-conifer | 25 | >30 | >30 | 27.5 (120) | 30 (12) |
| CP ⁴ , UGM, BRW Pine-oak ⁵ | 10 | >30 | >30 | 25.3 (110) | 30 (12) |

¹% of area pertains to the percent of the planning area, subregion, and/or region in the specified forest type that should be managed for threshold conditions.

⁴Pine-oak forest type: \geq 10% of the stand BA or 4.6 m₂/h_a (20 ft₂/ac) of BA consist of Gambel oak \geq 13 cm (5 in) drc.

⁵Pine-oak recommendations apply only to the Mount Taylor and/or Zuni Mountains regions within the CP EMU.

U.S. Fish and Wildlife Service (USFWS). 2012. Final Recovery Plan for the Mexican Spotted Owl (*Strix occidentalis lucida*), First Revision. U.S. Fish and Wildlife Service. Albuquerque, New Mexico, USA. 413 pp.

²BAs in m₂/ha (ft₂/acre), and include all trees >1 inch dbh (i.e., any species). We emphasize that values shown are **minimums**, not targets.

 $^{^{3}}$ Trees > 46 cm (18 inches) dbh. Density is tree/ha (trees/acre). Again, values shown are minimums rather than targets. We encourage retention of large trees.
